

ABSTRACT OF THE DISCLOSURE

A roofing washers assembly includes a plurality of stacked roofing washers and a positioning roofing washer is located at an end of the stacked roofing washers. An elongate flexible member extends through the central apertures of the stacked roofing washers and the positioning aperture of the positioning roofing washer. The diameter of the elongate flexible member is smaller than an inner diameter of the central apertures and larger than an inner diameter of the positioning aperture, so that a first end of the elongate flexible member is force-fitted with the positioning aperture and can be disengaged from the positioning aperture when the elongate flexible member is forcibly pulled from the second end thereof.
